

Class Task

JTree

Task:

Design and implement the following JTree interface

Code snippets for “Print Tree”:

```
private void printToConsole() throws IOException{
    DefaultMutableTreeNode root = (DefaultMutableTreeNode) treeStudents.getModel().getRoot();

    if (root.getChildCount()==0) return;

    System.out.println(root);

    int childCount = root.getChildCount();
    for (int i=0; i<childCount; i++){
        System.out.println("\t"+ root.getChildAt(i));

        int leafCount = root.getChildAt(i).getChildCount();
        if (leafCount == 0){}
        else{
            for (int j =0; j<leafCount; j++){
                System.out.println("\t\t" + root.getChildAt(i).getChildAt(j));

                int dataCount = root.getChildAt(i).getChildAt(j).getChildCount();
                if (dataCount == 0){}
                else{
                    for (int k =0; k<dataCount; k++){
                        System.out.println("\t\t\t" + root.getChildAt(i).getChildAt(j).getChildAt(k));
                    }
                }
            }
        }
    }
}
```

Code snippet for “Add City” operation:

```
private void AddCityActionPerformed(java.awt.event.ActionEvent evt) {  
    DefaultTreeModel model = (DefaultTreeModel) treeStudents.getModel();  
    DefaultMutableTreeNode root = (DefaultMutableTreeNode) model.getRoot();  
    String city = txtCity.getText().trim();  
  
    if (!city.equals("")){  
        root.add(new DefaultMutableTreeNode(city));  
        model.reload();  
        lblStatus.setText("New City added to tree");  
        txtCity.setText("");  
        AddCity.setEnabled(false);  
    }else{  
        JOptionPane.showMessageDialog(this, "City field is empty", "Error!", JOptionPane.ERROR_MESSAGE);  
        lblStatus.setText("Please enter a City");  
        txtCity.setText("");  
        AddCity.setEnabled(false);  
    }  
}
```

Some important classes and methods:

- DefaultTreeModel
 - o model.insertNodeInto(newDistrict, selectedNode,selectedNode.getChildCount())
- DefaultMutableTreeNode
 - o JTree.getModel().getRoot()
 - o JTree.getLastSelectedPathComponent()
 - o selectedNode.getChildCount()
 - o selectedNode.getChildAt(int index)
